

I'm not robot!

Hi, I upgraded jupyterhub to 1.3.0 (jinja2 2.11.3), but all my services stopped showing up. For example the jupyterhub announcement service, I get 503 : service unavailable and in the log file: 15:34:30.180 [ConfigProxy] debug: PROXY WEB /services/announcement/ to jupyterhub[31684]: ERROR:tornado.application:Uncaught exception jupyterhub[31684]: Traceback (most recent call last): jupyterhub[31684]: File "/usr/local/lib64/python3.6/site-packages/tornado/http1connection.py", line 273, in read_message jupyterhub[31684]: delegate.finish() jupyterhub[31684]: File "/usr/local/lib64/python3.6/site-packages/tornado/routing.py", line 268, in finish jupyterhub[31684]: self.delegate.finish() jupyterhub[31684]: File "/usr/local/lib64/python3.6/site-packages/tornado/web.py", line 2297, in finish jupyterhub[31684]: self.execute() jupyterhub[31684]: File "/usr/local/lib64/python3.6/site-packages/tornado/web.py", line 2317, in execute jupyterhub[31684]: self.application, self.request, **self.handler_kwargs jupyterhub[31684]: File "/usr/local/lib64/python3.6/site-packages/tornado/web.py", line 233, in __init__ jupyterhub[31684]: self.initialize(**kwargs) # type: ignore jupyterhub[31684]: File "/usr/local/lib/python3.6/site-packages/jupyterhub/announcement/announcement.py", line 132, in initialize jupyterhub[31684]: self.template = self.env.get_template("index.html") jupyterhub[31684]: File "/home/jupyterhub/local/lib/python3.6/site-packages/jinja2/environment.py", line 883, in get_template jupyterhub[31684]: return self.load_template(name, self.make_globals(globals)) jupyterhub[31684]: File "/home/jupyterhub/local/lib/python3.6/site-packages/jinja2/environment.py", line 857, in load_template jupyterhub[31684]: template = self.loader.load(self, name, globals) jupyterhub[31684]: File "/home/jupyterhub/local/lib/python3.6/site-packages/jinja2/loaders.py", line 429, in load jupyterhub[31684]: raise TemplateNotFound(name) jupyterhub[31684]: Jinja2.exceptions.TemplateNotFound: index.html jupyterhub[31684]: 15:34:30.183 [ConfigProxy] error: 503 GET /services/announcement/ socket hang up jupyterhub[31684]: [D 2021-04-08 15:34:30.186 JupyterHub pages:648] No template for 503 I got the same error with similar services. Downgrading jinja2 to 2.10.1 for example fixes temporary the problem. Any idea? As traduções são geradas por tradução automática. Em caso de conflito entre o conteúdo da tradução e da versão original em inglês, a versão em inglês prevalecerá.Você pode personalizar a configuração do JupyterHub No Amazon EMR e notebooks de usuários individuais, conectando-se ao nó principal do cluster e editando os arquivos de configuração. Depois de alterar os valores, reinicie o contêiner jupyterhub.Modifique as propriedades nos seguintes arquivos para configurar o JupyterHub e cadernos individuais Jupyter: jupyterhub_config.py—Por padrão, esse arquivo é salvo no/etc/jupyter/conf/Diretório no nó principal. Para obter mais informações, consulteNoções básicas de configuraçãoo JupyterHub documentaçãojupyter_notebook_config.py—Este arquivo é salvo no/etc/jupyter/diretório por padrão e copiado para ojupyterhubcontêiner como padrão. Para obter mais informações, consulte Arquivo de configuração e opções de linha de comando na documentação do Notebook Jupyter.Você também pode usar a classificação de configuração jupyter-sparkmagic-conf para personalizar o Sparkmagic, que atualiza valores no arquivo config.json para o Sparkmagic. Para obter mais informações sobre configurações disponíveis, consulte o example_config.json no GitHub. Para obter mais informações sobre como usar as classificações de configuração com aplicativos no Amazon EMR, consulteConfigurar aplicativos.O exemplo a seguir inicia um cluster usando a AWS CLI fazendo referência ao arquivo MyJupyterConfig.json para as configurações de classificação de configuração do Sparkmagic.Caracteres de continuação de linha Linux (\) estão incluídos para legibilidade. Eles podem ser removidos ou usados em comandos do Linux. Para Windows, remova-os ou substitua por um circunflexo (^).aws emr create-cluster --use-default-roles --release-label emr-5.14.0 --applications Name=Jupyter --instance-type m4.xlarge --instance-count 3 --ec2-attributes KeyName=MyKey,SubnetId=subnet-1234a5b6 --configurations file://MyJupyterConfig.jsonOs conteúdos de exemplo de MyJupyterConfig.json são os seguintes:[{ "Classification": "jupyter-sparkmagic-conf", "Properties": { "kernel.python.credentials": "({\"username\": \"diego\", \"base64_password\": \"mypass\", \"url\": \"http://localhost:8998\", \"auth\": \"None\"})" }]Com o Amazon EMR versão 5.21.0 e posterior, você pode substituir as configurações de cluster e especificar classificações de configuração adicionais para cada grupo de instâncias em um cluster em execução. Você faz isso usando o console do Amazon EMRAWs Command Line Interface(AWS CLI), ou oAWSSDK. Para obter mais informações, consulteFornecer uma configuração para um grupo de instâncias em um cluster em execução. i use flask and i got this error when i call this uri: /login Here's my login method: @app.route('/login') def login(): if authenticateForPanel(): return redirect(url_for("panel")) else: getParam = request.args.getlist('redirect uri') if getParam: ref =getParam[0] else: ref="/panel" return render_template(themesDir + g.blogOptions['active theme']+/login.html', blogOptions = g.blogOptions, ref=ref) And the traceback: Traceback (most recent call last): File "/Users/ozcan/Library/Python/2.7/lib/python/site-packages/flask/app.py", line 1701, in __call__ return self.wsgi_app(environ, start_response) File "/Users/ozcan/Library/Python/2.7/lib/python/site-packages/flask/app.py", line 1689, in wsgi_app response = self.make_response(self.handle_exception(e)) File "/Users/ozcan/Library/Python/2.7/lib/python/site-packages/flask/app.py", line 1687, in wsgi_app response = self.full_dispatch_request() File "/Users/ozcan/Library/Python/2.7/lib/python/site-packages/flask/app.py", line 1360, in full_dispatch_request rv = self.handle_user_exception(e) File "/Users/ozcan/Library/Python/2.7/lib/python/site-packages/flask/app.py", line 1358, in full_dispatch_request rv = self.dispatch_request() File "/Users/ozcan/Library/Python/2.7/lib/python/site-packages/flask/app.py", line 1344, in dispatch_request return self.view_functions[rule.endpoint](**req.view_args) File "/Users/ozcan/Documents/python/app.py", line 209, in login return render_template(themesDir + g.blogOptions['active theme']+/login.html', blogOptions = g.blogOptions, ref=ref) File "/Users/ozcan/Library/Python/2.7/lib/python/site-packages/flask/templating.py", line 124, in render_template return render_ctx.app.jinja_env.get_or_select_template(template_name_or_list) File "/Users/ozcan/Library/Python/2.7/lib/python/site-packages/jinja2/environment.py", line 758, in get_or_select_template return self.get_template(template_name_or_list, parent, globals) File "/Users/ozcan/Library/Python/2.7/lib/python/site-packages/jinja2/environment.py", line 719, in get_template return self.load_template(name, name) File "/Users/ozcan/Library/Python/2.7/lib/python/site-packages/flask/templating.py", line 61, in get_source raise TemplateNotFound(template) TemplateNotFound: static/themes/default/login.html I am absolutely sure the login.html is there(static/themes/default/404.html).Why can this occur? You can't perform that action at this time. You signed in with another tab or window. Reload to refresh your session. You signed out in another tab or window. Reload to refresh your session. The pages of the JupyterHub application are generated from Jinja templates. These allow the header, for example, to be defined once and incorporated into all pages. By providing your own templates, you can have complete control over JupyterHub's appearance. JupyterHub will look for custom templates in all of the paths in the JupyterHub.template_paths configuration option, falling back on the default templates if no custom template with that name is found. This fallback behavior is new in version 0.9; previous versions searched only those paths explicitly included in template_paths. You may override as many or as few templates as you desire. Jinja provides a mechanism to extend templates. A base template can define a block, and child templates can replace or supplement the material in the block. The JupyterHub templates make extensive use of blocks, which allows you to customize parts of the interface easily. In general, a child template can extend a base template, page.html, by beginning with: {% extends "page.html" %} This works, unless you are trying to extend the default template for the same file name. Starting in version 0.9, you may refer to the base file with a templates/ prefix. Thus, if you are writing a custom page.html, start the file with this block: {% extends "templates/page.html" %} By defining blocks with same name as in the base template, child templates can replace those sections with custom content. The content from the base template can be included with the {{ super() }} directive. To add an additional message to the spawn-pending page, below the existing text about the server starting up, place this content in a file named spawn_pending.html in a directory included in the JupyterHub.template_paths configuration option. {% extends "templates/spawn_pending.html" %} {% block message %} {{ super() }} Patience is a virtue. {% endblock %} To add announcements to be displayed on a page, you have two options: Extend the page templates as described above Use configuration variables If you set the configuration variable JupyterHub.template_vars = {'announcement': 'some_text'}, the given some_text will be placed on the top of all pages. The more specific variables announcement_login, announcement_spawn, announcement_home, and announcement_logout are more specific and only show on their respective pages (overriding the global announcement variable). Note that changing these variables require a restart, unlike direct template extension. You can get the same effect by extending templates, which allows you to update the messages without restarting. Set c.JupyterHub.template_paths as mentioned above, and then create a template (for example, login.html) with: {% extends "templates/login.html" %} {% set announcement = 'some message' %} Extending page.html puts the message on all pages, but note that extending page.html take precedence over an extension of a specific page (unlike the variable-based approach above).
